

COMMUNICATIONS

POLICY DISCUSSION DOCUMENT

March 2012

COMMUNICATIONS POLICY DISCUSSION DOCUMENT
**BUILDING AN INCLUSIVE SOCIETY THROUGH INFORMATION AND
COMMUNICATION TECHNOLOGY**

INTRODUCTION

An inclusive and growing information society enabling development

1. Over the last three decades, the world has been undergoing, and continues to undergo, an information and communication technologies (ICT) revolution, which has fundamentally transformed the way people live and relate to one another. This has made the world a much smaller place, in which individuals can access information and services from wherever they are in the world.
2. The same ICTs have turned this globalizing world economy into a knowledge economy, where access to information and knowledge becomes the key determinant of the extent to which individuals, communities, societies and whole regions can shape their own lives and compete for jobs and services.
3. Globalisation, however, has also sharpened inequalities between regions and nations, and within nations, producing winners and losers and a core and a periphery. ANC's policy is aimed at fighting this segregation and inequality, and working nationally and internationally to ensure a more just social order.
4. This document seeks to provide a framework for policy discussion on media, communications and ICT within the ANC and its structures as part of the preparations for the Policy Conference and the 53rd National Conference in 2012. It builds on the decisions of the 51st and 52nd conferences and also takes into account ongoing endeavours by the ANC government to deliver services to the citizens.
5. While more emphasis is placed on ICTs, the document still deal in detail with the print media and the postal sectors. There is a need to pay the necessary attention to the print media which continues to play a critical role in the battle of ideas within society. Media transformation and media diversity remain very critical in the ongoing nation building effort. Similarly, the role of the Postal infrastructure cannot be under-estimated. A long term perspective is needed around the future role of the Post Office and the Post Bank in social transformation.

6. Where necessary, the document reaffirms previous conference decisions, especially those that are yet to be implemented (*reference to the National Conference and General Council resolutions*). While proposing new policy interventions, the document places more emphasis on the need for an over arching national ICT policy which will inform the future growth and developmental trajectory of the ICT sector.
 7. As a build up towards the new vision, to be articulated in the National ICT policy, the document proposes various policy interventions across the following areas:
 - a) **Information and Communications Technologies and Development Perspective**
 - b) **Research, Development And Innovation**
 - c) **Broadcasting Infrastructure and Services**
 - d) **Print Media Transformation**
 - e) **Postal Infrastructure and Post Bank**
 - f) **ICT and Improving Organisational Effectiveness and Efficiency**
 8. The celebration of the 100 years of the ANC provide us with a rare moment to reflect on the achievements and the challenges hitherto, as we prepare for the next 100 years. Robust discussions are needed to help the ANC and society as a whole to emerge with new policies and decisions that will increase the pace of innovation and service delivery.
- A. INFORMATION AND COMMUNICATIONS TECHNOLOGY AND DEVELOPMENT PERSPECTIVE**
9. Over the last three decades, the world has experienced an unprecedented social and economic revolution driven by the advent of high speed internet networks or information and communication technologies (ICTs) capable of transmitting huge chunks of information across borders with a single click.

10. These technologies have almost overnight blurred the traditional divide between the information technologies (computers), telecommunications (telephones), broadcasting (TV and radio) and content. As a result, any single gadget can be used to engage in multiple transactions across these services. As an example, today a mobile phone/cellphone can be used to generate documents, send email, act as a radio and TV.
11. New applications such as electronic government, e-health, online money transfers, online billing and over the Internet payment of government and private transactions have emerged transforming the workplace and the skills that are required by the mainstream economy. These electronic based transactions have also reduced the need for paper and the distance people travel to embark on transactions.
12. This revolution, known as the information society, has fundamentally transformed the way people live and relate to one another and their societies. This has made the world a much smaller place, in which individuals can access information and services from wherever they are in the world.
13. The global economy has also experienced watershed transformation into a knowledge economy, where access to information and knowledge becomes the key determinant of the extent to which individuals and communities contribute to their own and societal development.
14. ICTs contribute to the economy both as a stand alone sector and as a facilitator of growth and development across the other sectors of the economy. For example, the tourism and transport sectors depends on the ICT sector for online bookings, which cuts the distance and the costs.
15. Trillions of Rands are transmitted over the ICT networks overnight, which also redefines the flow of Foreign Direct Investments across the globe. Money is now invested through the computer networks and can easily be transacted across borders at short notice.
16. As globalisation intensifies, driven by ICTs, it has also sharpened inequalities between and within communities. It has produced winners and losers. South Africa is by no means an exception to the rising tide of inequality between the haves and have-nots.
17. The prevailing inequalities, commonly known as the digital divide, have constrained the ability of many citizens to participate in the mainstream economy thus entrenching the spectre of poverty and underdevelopment afflicting many people in the world as a whole and in our country in particular.

18. Since the advent of democracy in 1994, the country has made significant strides to facilitate the transformation of the industry and this include:

- a) The introduction of new laws which facilitate the provision of ICT services to the people, including in rural areas. This include the licensing of community radio, ICT centres and obligations on the mobile services.
- b) The transformation of the SABC from an apartheid mouthpiece to a credible public broadcasting institution. In recent years, the SABC has played a very important role in the national and local elections thereby strengthening our democratic discourse.
- c) New subscription television and commercial radio stations have also been licensed to contribute to diversity of voices and the participation of people from historical disadvantaged communities.
- d) Creation of an independent regulatory environment to ensure that the licensing of services takes place in a transparent and fair manner.
- e) Opening of the telecommunications to new players although their role and contribution remain constrained by limited access to the radio frequency spectrum.
- f) Mobile penetration stands at more than 100% percent although access to broadband is constrained by high fees.
- g) South Africa hosts the most powerful computer system in Africa, which is among the top 500 super computers in the world. This facility provides the country with capabilities to perform complex scientific and mathematical calculations to resolve environmental biomedical sciences and the study of astronomy.
- h) Government has also introduced other ICT innovations to involve young South Africans including out of school youth in ICT entrepreneurship opportunities.

19. Meanwhile in recent years South Africa has lagged behind in a number of key global ICT indicators, especially on universal access to the internet, broadcasting and e-governance. This has resulted in part from fragmented and uncoordinated policy and institutional arrangements. As a result, we have not fully exploited the opportunity presented by these technological advances.

20. Even on the continent, the country has lost its position as a leader in the rollout of ICT services. Countries such as Senegal and Egypt are

emerging as leaders. South Africa also lags behind the other BRICS countries in almost all aspects of the ICT value chain.

21. While mobile or cellular communications has reached over 100% penetration, the same cannot be said of the High Speed Internet Networks with penetration levels of less than 20% of the population. A significant number of South Africans access ICTs at their place of work although the advent of smart phones such as blackberry and i-phone are changing this. The high prices charged by industry remain a big challenge towards a full utilisation of ICT services even by many people who already own smart phones.
22. Mobile broadband penetration still stands at less than 11% (households) and 8% (business) while according to the International Telecommunications Union fixed broadband in South Africa is at below 10%.
23. Universal broadcasting signal is not available in about 448 rural and remote areas of our country. Telecommunication infrastructure by Telkom is limited to 8% of the country's metropolitan councils and largely covers work usage by government and large companies. Mobile operators such as MTN, Vodacom, Cell C and 8ta provide high speed 3G broadband/internet services, however the speed of internet reduces to 2G in some rural and remote areas.
24. On the skills front, many young people from historically disadvantaged backgrounds come out of the Basic Education system never having been exposed to ICTs. This impacts their performance in institutions of higher learning, as well as their ability to adapt and become competent in the use of ICTs even beyond that. Related to this is that post-school education and training system (colleges and universities) produces graduates that are insufficiently e-skilled, regardless of their chosen profession.
25. In addition to general inadequate ICT skills output from the educational system, the country has not also invested in developing specialised Research and Development Skills. Yet there is great potential in ICT R&D and Innovation that need to be unlocked in order for the country to become globally competitive.
26. There remain serious gaps that have constrained the sector's ability to respond to the needs of the people especially the rural and urban poor. Part of the reason behind this, is limited consumer choice due to limited competition in the telecommunications and broadcasting markets, especially the pay TV market. Competition is important for consumers to access to choose their preferred service providers thus fuelling price wars in their own interest.

27. There are reasons for current state of the ICT sector in the country and these include:

- a) The lack of a comprehensive national ICT policy, leading to overlaps and competition within government.
- b) Institutional misalignment and limited accountability.
- c) Limited e-skills within the state and society as a whole.
- d) High turnover, and corporate governance challenges in the key institutions and the department.
- e) Inadequate funding of projects aimed at promoting universal service and access.
- f) Failure by the policy and regulatory institutions to enforce compliance with the law.
- g) Limited and misaligned research and development.
- h) Policies are not based on evidence, hence they keep on changing even before the results can be realised; and
- i) Failure to implement some of the decisions of the previous ANC conferences and the National General Council.

28. Our drive towards a new vision of the sector should seek to provide a long term approach to addressing the identified challenges. In particular, the sector needs a long term stability to be in a position to take the country into the next trajectory.

KEY ISSUES AND POLICY PROPOSALS

I. National ICT policy

29. To maximise the value of the development of the ICT, and also accelerate the uptake and usage of the ICT tools, the ANC needs to create a coherent and co-ordinated national policy framework and strategy.

30. The National ICT Policy will:

- i. promote the provision of universal access to high speed, quality and affordable networks and services to ensure that government, communities, business and all our people become part of the Information Superhighway and the knowledge economy.

- ii.inform the deployment of ICTs across the country – national, provincial and local infrastructure. It will also outline the different roles of the state, private and community sectors in achieving this goal.
- iii.align uptake and usage with the development of indigenous knowledge systems and the revival of the local content industry.
- iv.inform regulatory interventions to ensure a world-class digital infrastructure connecting business centres and households in all areas of the country including in rural areas.
- v.define ICTs as a basic utility, similar to water and electricity.
- vi.set out targets to increase population coverage of high speed Internet access to 100% by 2030. This means that by this period, every South African should be within the reach of the ICT infrastructure. More endeavours, including access to receiver equipment such as computers, are needed to ensure that South Africans can use the available network.
- vii.provide for an institutional framework that enhances collaboration, effective planning and oversight.
- viii.outline approaches to uptake and usage to promote e-applications in e-government, health, education, fighting crime.

II.Institutional Mechanism

- 31.The institutional framework within government is perhaps the greatest barrier to the emergence of a coherent government strategic thinking, effective planning and deployment infrastructure and services to the people. There is a need for a rethink on how government is organized to discharge its services timeously within the available resources.
- 32.As a point of departure government should develop and retain policy making capacity. The current Department of Communications which has been a missing link should be transformed into a new “Department of Information and Communication Technologies and Postal Services” to coordinate government wide ICT policy formulation as well as oversee its implementation.
- 33.A National ICT Forum should be created comprising government and industry to engage on critical issues of mutual interest. Civil society should also be invited to participate in the Forum.

34.The following state institutions must be rationalised to address existing overlaps, duplication and undue competition within the state:

- i.the Presidential National Commission on ICT,
- ii.the State Information and Technology Agency,
- iii.the Office of Chief Government Information Council (GITOC)
- iv.Government Information and Technology Officers at provincial level
- v.Broadband Infraco and any other state owned entities in the ICT sector
- vi.Sentech
- vii.Universal Service and Access Agency of South Africa (USAASA)
- viii.Media Development and Diversity Agency (MDDA)
- ix.NEMISA
- x.Meraka Institute
- xi.MICT SETA
- xii.FP&M SETA

III.e-Skills

35.As discussed at the National General Council, e-Skills should become a compulsory subject in all public schools to promote an e-literate society. This will also ensure that young people from rural areas are not abused by illegal training institutions in their quest to acquire the much sought after e-skills.

36.The curriculum should focus on end user computing as well as encouraging young people to pursue careers in the ICT sector. For South Africa to be a leader in the development, uptake and usage of ICTs, the country needs more skills than are currently available.

37.Government must also maintain a comprehensive database of the current skills as well as those that will be required in the medium to long term. This will require harmonisation and the creation of synergies between public and private sector initiatives.

38. Other successful nations have dedicated universities to produce highly skilled ICT professionals and experts. Various options should be explored, including developing one of the existing universities (or one of the new universities in Mpumalanga or Northern Cape or both) as a specialized ICT university. All other universities, especially the historically black campuses, must be supported to offer ICT education.
39. FET colleges should also be used as schools of excellence to create opportunities for out of school and unemployed young people.
40. Industry plays an important, strategic role in skills development. As one of the social partners, industry should be encouraged as well as incentivised to create opportunities for young people to receive experiential training. Government must introduce a comprehensive e-skills development plan which will include incentives to mobile industry co-operation for the benefit of young people. This must be in place by 2014.
41. A dedicated funding plan is needed to ensure that rural universities and FET colleges can contribute to the new e-skills revolution. The Skills Fund must prioritize the ICT skills development.
42. As a crucial part of the National ICT policy, research, development and innovation strategies and plans will enable increased public and private investment ICT by providing mechanisms to forecast technology developments in targeted areas; attracting real foreign direct investment (FDI) from ICT multinational companies; and identifying critical areas that must be developed to meet Sa's socio-economic objectives.
43. High impact national programmes such as the digital switch-over should facilitate local and international investments in research and development.

IV. Transformation of the industry

44. Our experience over the past years of democracy suggests that transformation cannot be achieved overnight, but it will be a process which will depend on the leadership provided by the ANC and its Government and the existence of well thought out programmes aimed at meeting the needs of our society.
45. The country's ICT sector transformation remains weak with BEE policy implemented to a very limited extent. Due to lack of adequate funding, procurement practices that do not promote black businesses, and absence of a focus on enterprise development, black companies continue to be left behind in the consistent growth of the ICT market. Whereas the ICT sector was the first sector to undertake steps to transform, much still

needs to be done and more new innovative interventions are needed to speed up the pace of transformation in all elements of the value chain in the ICT sector.

46.As part of the new National ICT Policy vision, ANC should focus on completing the transformation process by 2030. By this period, the ownership and control of the ICT sector should reflect national demographics including the role of black people, women and persons with disabilities in the sector.

47.The ANC need to prioritise the following interventions:

- i.A review of the empowerment targets in all the ICT subsectors and elements of the ICT value chain by 2014. This review will consider whether such targets are appropriate, reasons why they have not been met and what additional considerations should be had with regards to empowerment targets. The review will consider the regulatory and institutional structures overseeing the realisation of empowerment targets. To this end the regulatory capacity will be strengthened to ensure that ICASA is capable to set and enforce empowerment obligations on the industry;
- ii.In accordance with a drive towards vision 2030, the ANC should ensure that the empowerment rules apply equally to all entities, big and small local and international/multinational. The ANC should ensure that there is strong preference given to new companies to access scarce radio frequency resources going forward.
- iii.The review of the Broadcasting Policy by 2014 should be underpinned also by the policy desire to reduce barriers to entry, especially in the pay TV market. The new policy environment should be specific about areas that constitute barriers to entry in the entire broadcasting value chain.
- iv.It is ANC policy to support the convergence of technologies and services. However, the regulation of the ICT sector in the converged environment should not lead to the creation of consolidated vertical and horizontal monopolies or to abuse of dominance by existing operators. Competition rules and regulations dealing with opening the market to competition will be prioritised.
- v.The Universal Service and Access Agency (USAASA) charged with the mandate to contribute to the promotion of universal service in under-serviced areas should be reviewed after over ten (10) years

of existence to redefine its focus to increase the uptake and usage of ICTs.

vi. A new state entity to provide funding to SMMEs, BBBEE, Co-operatives and other Not for Profit initiatives in the electronic communications, broadcasting and postal sector should be created out of the merger between USAASA and the Media Development and Diversity Agency by 2014. The contribution by Industry to the merged entity should be uncapped and this should be accompanied by a coherent plan to expend the current allocation.

vii. The ANC should ensure that endeavours to resource ICASA in line with the decision of the 3rd National General Council should have commenced by the time of the policy conference. ICASA should be self-funding using licence fees, subject to Parliamentary procedures and oversight, by the beginning of 2013 financial year.

48. The licensing and use of the Radio Frequency Spectrum, which is a public asset, is another central pillar towards the creation of an industry that is responsive to the needs of all the people. In order to facilitate the diffusion of ICTs across society, the licensing of the scarce radio frequency resources should be underpinned by the following factors:

- i. Alignment of the spectrum allocation and licensing regime with the prevailing social and economic development context, while taking into consideration future needs.
- ii. Equitable allocation of the frequency spectrum to new licences, including SMMEs, to reduce entry barriers
- iii. Requirements and obligations to achieve universal coverage. This should be linked to building regulatory capacity to enforce compliance with the law.
- iv. promote Broad Based Black Economic Empowerment at the minimum of 30% to 50% direct ownership and control of ICT and broadcasting, including the empowerment of women and youth development. This must be achieved by 2020.

49. To maximise the value of the scarce or high demand spectrum, Government must set aside spectrum for the provisioning of wholesale services or open access network by the merged entity between Sentech and INFRACO.

50. This infrastructure must prioritise government services and provide modern communication services to government departments,

municipalities, schools, hospitals, clinics, police stations, and courts to ensure that they are connect and can provide e-services to the people. Excess capacity should be geared to further connect rural areas to help achieve full access to high speed internet networks by 2030.

51. Government should provide financial support capital to Greenfields operators starting business to provide services to under-served communities. These entities should also be entitled to a preferential interconnection (asymmetrical interconnection) rate and this should be mandatory..
52. The fact that South Africa does not design new innovations in the sector while a lot of money is pumped into the Science Councils is a serious missing link. For the country to position itself as an ICT hub for the continent, it requires high levels of research and development, and innovation, to allow for all manner of new inventions and technologies to emerge.

V. High speed internet infrastructure and services

53. It is the responsibility of government to maximise opportunities for all South Africans to benefit from the digital economy by laying firm foundations for digital infrastructure to reach all. Access to digital infrastructure, or more specifically high speed internet access, must be considered a basic utility for South Africans.
54. Informed by the National ICT policy, Government must introduce a National Broadband Plan. The National Broadband Plan must be revised and reviewed to take into account the proposals herein. The Broadband Plan must provide for:
55. A world-class digital infrastructure connecting business centres, households in all areas of the country and people including the urban poor as well as also those in rural areas is a prerequisite to the introduction of high speed access to modern digital means of communications, work and commerce.
56. Affordable quality services that will ensure that the majority of South Africans have access to the internet platforms necessary for them to transact with each other, their government and the private sector.
57. to expedite the deployment of high quality services, national policy should explore the combination of various reliable technologies such as satellite, wireless and , fibre. and other emerging technologies. The wholesale

services provided by the merged entity between Sentech and Infracore should use these technologies.

58. High demand spectrum that can be used to deliver high speed services using emerging technologies should be prioritised for assignment to new entrants. This should also encourage the use of emerging technologies which are spectrum efficient to increase competition and provide value for consumers.
59. On regular basis government through its regulatory capacity must conduct a review of spectrum usage to determine usage and re-allocation where necessary.
60. National policy should also deal with the security of the High Speed Internet Networks (cyber security) to ensure information security, including the protection of vulnerable sectors of society such as children. A national cyber security policy is needed without delay.
61. In the light of the drive towards the new policy vision, there is a need to also accelerate the endeavour to define needy people to address the utility expectations of, amongst others, people with disabilities, children, rural and urban poor. The needy people, as defined, should benefit from special subsidies to access and use communication services.
62. Public finance through the fiscus and the Developmental Finance Institutions (DFIs) should be set aside to finance broadband rollout as a national priority. There should be clear complimentary interventions between the contribution of the fiscus, DFIs and the merged entity between USAASA and the MDDA subsidising needy people.
63. A strengthened competition framework which also addresses the quality and affordability of broadband infrastructure and services should also find expression in the National Broadband Plan. The broadband implementation will ensure connectivity of schools, health centres, postal services, police stations, government offices and services centres to ensure access to all people in the country.

A. RESEARCH, DEVELOPMENT AND INNOVATION

64. The country continue to demonstrate excellence through major ICT and scientific breakthroughs emanating from research and development programmes. There is great potential in ICT R&D and innovation that needs to be unlocked in order for the country to become more globally competitive.
65. Highlights of recent world-class achievements include the following projects of the Department of Science and Technology:

- a) As part of the cyber-infrastructure programme which is implemented by CSIR in partnership with universities and other science councils, South Africa today hosts the most powerful computer in Africa, which is among the top 500 supercomputers in the world– currently at position 329. This is hosted at the Centre for High Performance Computing (CHPC) in Cape Town. This facility provide South Africa with enormous capability to perform complex scientific and mathematical calculations that solves real societal problems in environment and climate change, automobiles, bio-medical sciences and astronomy.
 - b) On the social impact side, some ICT R&D and innovation programmes of DST include the Digital Doorway (DD) – an innovative, robust computer facility that is deployed in under-serviced areas which members of the community can access anytime of the day to gain computer literacy skills and access relevant information, content and various applications. The human language technologies (HLT) research group develops technology solutions that address the language diversity of South Africa.
 - c) A flagship project that demonstrates the use of alternative, cost-effective and innovative technologies and models to deploy broadband infrastructure and services for rural communities is currently underway in Nkangala District Municipality in Mpumalanga. The project uses Wireless Mesh Network technology to connect close to 200 schools and a few other sites. 114 of these connections has been commissioned to the Internet. The project incorporates a business model that promotes local economic development. Unlike with conventional telecommunication network operator model, the Wireless Mesh Network uses the out-of-school youth who show entrepreneurial and technical potential to operate, support and maintain the network in their own communities.
66. The above examples illustrate how directed interventions on ICT R&D and innovation can bring about significant socio-economic development. However, to make real impact, the current investment in ICT R&D and innovation need to be increased multiple-fold in order to achieve a critical mass in ICT R&D.
67. We need to promote and support development of new ICT research & development (R&D) plans and strengthen existing strategies and policies to foster robust, well coordinated institutional arrangements that lead to development of indigenous world-class, technology innovations in ICT through directed national ICT research, development and innovation programmes.

68. There needs to be plans to increase the number of Masters and PhDs students enrolling and graduating in ICT. Over the past few years, South Africa has been graduating between 14 and 35 PhDs per year in ICT related fields. The starting point should be to increase the current ICT PhD production by 10 - 15 fold per year in order to enable critical mass of advanced ICT human capital.
69. While ICTs are widely recognised as potent tools and enablers for socio-economic development, South Africa still lacks adequate competencies, capacity and capabilities and hence the continued reliance on imported ICT products and services. If the status quo persists, the real impact of ICTs on economic growth will not be realised. This because there is enough evidence-based studies that show that the world's advanced economies have achieved their status largely because they have adopted and implemented policies that support technological (in most case ICT) innovation based on strong research and development capabilities.
70. The Science and Technology Department is currently finalising development of a long-term ICT R&D and Innovation (RDI) implementation roadmap. The roadmap is being developed in conjunction with CSIR and with inputs of all relevant stakeholders in the National System of Innovation.
71. The ICT R&D and Innovation roadmap, which will encapsulate short, medium and long-term implementation plans, seek to enable increased public and private sector funding for ICT RDI, definition of new, niche and strategic ICT focus areas for directed R&D aligned to government priorities, and a growing pipeline of R&D and innovation human resources, especially at Masters and PhD level. The roadmap will also provide concrete key performance measures, outputs and expected outcomes.
72. As a crucial part of the National ICT policy, research, development and innovation strategies and plans will enable increased public and private investment in ICT RDI by providing mechanisms to forecast technology developments in targeted areas; attracting real foreign direct investment (FDI) from ICT multinational companies; and identifying critical areas that must be developed to meet SA's socio-economic objectives.
73. Within the framework of the National ICT Policy, South Africa will overcome the "**Digital Divide**" by leveraging advances in ICT to address socio-economic challenges and thus create "**Digital Advantage**". Through sound investment and effective coordination of ICT R&D and innovation activities, the following conditions will be established:

- a) advanced human capital and strong institutional capacity, enabling critical mass for research in focussed ICT domains;
- b) a flourishing and growing high-tech ICT industry characterised by tight engagement with research communities, as well as fast uptake and promotion of research results and indigenous innovation;
- c) a healthy innovation ecosystem, in which research results flow unencumbered to government and industry to achieve impact in society;
- d) advanced ICT infrastructure connecting South Africa internally and with the world; and
- e) local content and applications that address local needs and also create export opportunities.

74. The investments in ICT R&D and innovation must continue to support existing research programmes - and enable creation of new ones - leading to achievement of ICT R&D critical mass through appropriate funding for R&D in higher education institutions, science councils and research institutions.

75. The building of research infrastructure; and attraction of foreign direct investment through various incentive schemes that will see large multinational ICT conglomerates setting up research and innovation facilities in South Africa - not just sales offices.

B. BROADCASTING INFRASTRUCTURE AND SERVICES

76. Various ANC Conference Resolutions and Policy documents capture the vision of a diverse South African broadcasting system; owned by the public, private and community sectors and reflective of the cultural, lingual and demographic diversity and unity inherent in our society.

77. The ANC has consistently upheld the notion that broadcasting operates at two levels. It acts as a means to reflect the rich South African cultural heritage, provides voice to South Africans to participate in democratic dispensation as well as acting as an important platform for community involvement, education, entertainment for millions of South Africans. Secondly, as part of the ICT industry, it is an important economic sector that sustains the South African creative industries.
78. Since the advent of democracy the ANC has been consistent in developing a policy environment that transforms the media sector to meet the broadcasting needs and wants of all the segments of the South African population. To this end television coverage has been extended to reach 92 of the population.
79. Radio coverage now reaches 95 percent of the population. All official South African languages are now reflected albeit in a limited manner on both television and radio. Radio and Television services are provided by an array of independent commercial operators. All District Municipalities are served by an array of geographic and community of interest stations.
80. Despite these achievements much still needs to be done to develop a broadcasting system that caters for all the needs of the South African population because of the inherent challenges facing the broadcasting system and the advent of digital terrestrial broadcasting. Some of the challenges requiring resolution include:
81. The public broadcasting system, beset by many structural, managerial and funding problems, needs to be restructured and repositioned to prioritise public service as opposed to the commercial focus that it has displayed.
82. The 51st and 52nd ANC Conference resolutions on funding have not been implemented due in part to the failure to develop a public broadcasting model that is not reliant on commercial programming, failure to cost the mandate as well as different interpretations on the role of public broadcasting in government.
83. The series of crises at the public broadcaster reflect a lack of leadership, lack of accountability and poor management. In confronting the crisis more emphasis has been placed on reporting processes without a corresponding attention to holding those responsible to account for the financial and organisational maladministration that has brought the public broadcasting institution to the crisis.
84. Such a situation has prevailed because institutional structures responsible for oversight have not been effective. There has also been an overlap in oversight roles enabling the public broadcaster to forum shop.

KEYS ISSUES AND POLICY PROPOSAL

- 85.The SABC must be restructured to prioritise public services in the digital age. As part of this process, Government must, in line with the resolutions of the 52nd conference, increase its funding of the SABC. This must be implemented progressively over a reasonable period.
- 86.Government funding must be ring fenced to be targeted towards public programming such as indigenous languages, developmental and educational programming. In addition to government funding, the SABC requires a long term sustainability strategy based on a people centred approach to public broadcasting.
- 87.Programming supporting education, health, poverty eradication, rural development, crime prevention and other societal priorities are miniscule compared to programming that is entertainment based. Budgets devoted to developmental programming are reflective of the miniscule programming output targeting the developmental agenda. This need to be revised as a matter of urgency.
- 88.The Public broadcasting system should not be allowed to lag behind the commercial sector in terms of technological innovations. In this regard any future strategy of the SABC must position the broadcaster as a leader in the uptake and usage of new technologies including Mobile TV and IP TV.
- 89.A stable corporate governance mechanism is required to provide long term stability. These include strengthening the SABC's accountability to Parliament, Government as a shareholder and the public. The public ownership of the SABC is central to its existence and sustainability.
- 90.Significant entry barriers remain in place in the pay commercial broadcasting sector. Regulation of this sector to enforce effective competition has not produced the desired competition. There is a need to relook at the behaviour of dominant players, access to premium content including sports rights and access to critical infrastructure by the competitors in this sector to enable the entry of new Pay TV services during the migration process, and new FTA players after switch-over in 2015.

91. The commercial broadcasting sector is still dominated by foreign programming even though media consumption patterns have demonstrated beyond doubt the predominant preference of South African content. Local content quotas need to be reviewed for all tiers of broadcasting. Raising the production levels and values of the South African content will in turn require collaboration by the various governmental entities that are active in the cultural creative industries space.
92. While broadcasting is delivered through ever changing technologies, it remains a content and cultural industry. In light of this strategic role of broadcasting, the current local content quotas at 55% for SABC 1 & 2, 30% for eTV and SABC 3 and 10% for Pay TV services do not support our long term vision. Compared to other countries such as Canada, Australia and Nigeria, SA has one of the lowest content obligations in the whole world. Many countries continue to impose foreign ownership limitations of the media. In its approach to this matter, the ANC maintains that the broadcasting policy review must prioritise national social and economic goals above private interests.
93. In addition, the broadcasting policy must also provide a strategy to fast track the local content development industry. The review of local content quotas must be aligned to this strategy.
94. Much still needs to be done to ensure that the community-broadcasting sector is reflective of the communities in terms of directorship, management and programming. There is a need for concerted action to ensure a fair representation of women, the workers, people with disabilities, children and the aged. Programming offered by the community sector still need to be diversified to cater for the special needs of these strata while also contributing to community development and upliftment.
95. The capacity of ICASA to effectively regulate in the public interest still shows limitation occasioned by funding constraints, skills shortage and confusion on the means and ways of achieving effective regulation. There is an overriding need to boost the capacity of the regulator to effectively monitor the broadcasters in order to enforce licence conditions and regulations.
96. The analogue system of broadcasting must be switched off by 2015 and a digital terrestrial system should be built to replace it. This will require considerable funds to maintain the penetration levels that have been achieved to date. Given its immense public benefits, DTT should be treated as a service with wider implications beyond the ICT sector and broadcasting.

97. The terrestrial digital way of distributing and accessing the television broadcasting services presents a fresh opportunity for South Africa to realise the policy ends that are defined in the broadcasting environment. There is a need to review the broadcasting system and policy framework in its entirety before 2015, to identify the gaps and barriers that have prevented the realisation of some of the important goals as well as plan for new services. This should culminate in a new forward looking broadcasting policy to coincide with switchover by 2015.
98. Government must ensure that such a review is open to participation by all segments of the South African population and outcomes informed by their needs. As such DTT should be present an opportunity to create a new industry that is owned and controlled by South Africans. The manufacture of Set-Top-Boxes (STBs) should be linked to a long term vision to manufacture Integrated Digital TVs (IDTVs) for local and external markets. More emphasis needs to be placed on the inter-operability of STBs on both pay TV and free to air to address consumer and competition needs.
99. For government to promote a new manufacturing environment, the current tariffs should be reviewed as they do not protect vulnerable industries. Digital broadcasting should be implemented as soon as possible in order to accelerate accelerated to the release the of “digital dividend” spectrum. The ITU recognises that the Digital Dividend is to be allocated to new broadcasting services, wireless services, mobile broadband, public emergency and other services.
100. The broadcasting policy review should create a regulatory framework for satellite services uplinking in the country as well as those that uplink outside our borders. Appropriate public broadcasting obligations should also be imposed on commercial services, Pay TV and Free to Air Services (FTAs) to ensure that public frequencies benefit more than just the owners and operators.

C. PRINT MEDIA TRANSFORMATION

101. In 1992, the ANC adopted a Media Charter which set out the organisation’s commitment to the creation of an environment to promote media diversity and media freedom. Over the years, the ANC has successfully introduced legislation to promote and protect media freedom. At the same time, various interventions were introduced to promote media diversity. The later include the creation of the Media Development and Diversity Agency to support community media and small commercial media outlets.

102. The print sector is still dominated by four big players, namely Naspers, Avusa, Caxton and the Independent Group. These companies also dominate the entire value chain of the market especially printing, distribution and advertising. This integration and the very market structure is perhaps the biggest barrier to market entry and potentially shows possible anti-competitive behaviour. Other mainstream media players include the M&G Media and TNA Media. Then, exist a number of small commercial print and community print media, who all face the challenge of sustainability.
103. Over the years, the ANC has remained resolute that the media including print media patterns of ownership, management and content must reflect the democratic dispensation ensuring the freedom of expression of the media, freedom of expression of the citizens as well as ensuring other rights guaranteed to South Africans in the Constitution and Bill of Rights.
104. Despite protestations and evident denial the print media existed for many years as one of the pillars of the apartheid super structure providing rationale and intellectual support to apartheid practice. Whatever progressive media that fought for the democratisation of society was initiated and linked to mass democratic movement led by the ANC.
105. The apartheid patterns and behaviour that treat South Africans in an unequal and discriminatory manner sometimes manifests in some of the conduct of the print media including the content, coverage, distribution, management and opinions. Despite denials, this is natural, such attitudes and practices need to be confronted for the media to be a mirror of the present democratic dispensation. The reality arising out of this situation is that the majority of South Africans do not have media that report on and project their needs, aspirations and points of views onto the national discourse.
106. Recent reports from the Media Development and Diversity Agency and the Print Media of South Africa indicate that despite some transformational changes that have taken place since 1994, regrettably the facts are that the average black ownership in SA mainstream print media to date is 14% and women participation (*at Board and management levels*) is 4.44%.

KEY ISSUES AND POLICY PROPOSAL

107. The ANC needs to review its own Media Charter in view of the developments that have taken place since its adoption, strides that have been made in realizing the rights enshrined in it as well as the emergence of new technologies.

108. The ANC remains committed to a media climate that is free from vested political and commercial interests. This has been the guiding principle in our engagement with the ongoing discussion on media transformation and accountability. Within this understanding, the ANC reaffirms the need for Parliament to conduct an inquiry on the desirability and feasibility of an appeals tribunal within the framework of the Constitution.
109. The envisaged Parliamentary process should reinforce the Constitution, Act 108 of 1996; review the existing media accountability mechanisms; balance the rights to dignity and freedom of expression and freedom of the media; review the privacy laws as well as those dealing with libel and defamations; and be empowered to impose sanctions without the loss of any constitutional rights.
110. The departure point of the ANC is that South Africans must enjoy the freedom of expression in the context of a diverse media environment which is reflective of their situations and daily experiences. Accordingly the following must be introduced to encourage media diversity:
- a) Introduction of an economic empowerment charter to promote BBBEE in the sector. Amongst others, the Charter should address the availability of print media in languages South Africans speak and communicate with, choice of societal issues that are neglected, right.
 - b) Strengthening the MDDA to support more community and commercial entities.
 - c) The Competition Commission should focus on anti-competitive practices within the sector.

D. POSTAL INFRASTRUCTURE AND THE POST BANK

111. The postal infrastructure plays a significant role in the social and economic development of the country. The ANC through its Government has over the years pursued efforts to stabilise the Post Office through a range of interventions, including the allocation of financial and other resources for the SOE to meet its obligations.
112. The Postal network has been expanded to reach 2400 outlets. The re-balancing of the postal infrastructure to ensure that 1 postal outlet serves a maximum of 10 thousand South Africans. This re-balancing exercise seek to redress the imbalances between the urban and rural areas of the country.

113. Part of the strategy is to achieve universal access, including the rollout of addresses and other services to under-serviced urban and rural areas. Through its massive, extensive network, the Post Office act as a pay point for many government services including municipality bills and traffic fines. This contribution helps alleviate backlogs in the delivery of services to the people which is central trust of the National Democratic Revolution.

KEY ISSUES AND POLICY PROPOSAL

114. The National Address System should prioritise the roll-out of addresses to informal settlements and rural to ensure addressability fo all households to achieve economic inclusion.

115. The current governmental financial support for infrastructure re-balancing including the roll-out of the National Address System should be continued.

116. Progress is being made to transform and corporatize the Post Bank as a preferred bank of choice for the poorest in urban and rural areas. However, more work is needed to establish a sustainable mechanism for the Post Bank. The Postal Infrastructure and the Postbank are needed for government to deliver services to the people. As such, ownership of the Post office and the Post Bank by government should be linked to efforts to ensure that the two institutions are sustainable. A State Bank should not only be defined in terms of ownership, but in terms of the services that are delivered by the Postbank.

117. To achieve this, Government should introduce policy guidelines to direct opportunities to the Post Bank as a bank of first choice of government and a primary platform for government and citizens transactions. Over the next ten years, the Post Office should continue with the exclusive rights to all letters up to 1kg.

118. This is in line with the Postal Licence Act of 1998 which confers South African Post Office (SAPO) exclusive rights and priviledges to be the monopoly on the provision of the basic letter service up to 1kg in order “to offset the cost of providing a basic service in low-density, rural or uneconomical areas,” as is a common practice globally.

119. The challenge however is that the advent of emails and sms has led to reduction in mail volumes. This has lowered SAPO profitability for re-investment in under serviced areas and to roll-out the infrastructure. Directing opportunities to Post Bank and Post Office will strengthen revenue diversification and provide a viable alternative for offsetting the cost of services to the under serviced and marginalised areas.

120. In the view of the ANC, the Postal market is not ready for liberalisation. Evidence in the courier market point to local and international courier

companies paying more attention to the lucrative urban areas to the detriment of the rural and peri-urban areas who can get services based on internal market cross-subsidization.

121. The ANC acknowledges that the decision to protect the exclusivity of the Post office should not compromise the provision of affordable, quality services. ICASA, as a regulator, need to be strengthened with the necessary capacity to regulate the postal market.
122. Strengthening ICASA as a regulator has to also address policy gaps to improve postal regulation efficiency and effectiveness in reserved and unreserved postal services. This includes courier services, courier brokers and extraterritorial offices of exchange. Extraterritorial offices of exchange refers to international mail houses sending mail either electronically or physically to entities in South Africa. Of concern are illegal operators and broader transformation in the sector.
123. Postal infrastructure is important in the ongoing efforts to promote regional integration. National policy should clarify approach to the regulation of cherry picking behaviour of international courier companies. The current practice to dump international mail on the Post Office infrastructure without paying anything has a long term detrimental effect on the sustainability of the Post Office. A policy to curtail this practice should be implemented by government. This will include compliance with the international tariff regime.
124. All three spheres of government must be encouraged to use the Post Office.. For its survival, the postal market must continue to expand infrastructure which will be used in the distribution network. The connected Community Service network must also diversify services to integrate online services. To this end the Post Office must be supported to accelerate evolution and migration of traditional postal services to e-services using innovative technology platforms and electronic channels.

E. ICT AND IMPROVING ORGANISATIONAL EFFECTIVENESS AND EFFICIENCY

125. The ANC has often been in the forefront of strategies to engage with the reality of the information and communication revolution. It regularly uses research and opinion surveys to aid its elections strategy development, while at the same time emphasising internal communications (through organs such as *ANC Today*, *NEC Bulletin*, *Umrabulo*, various provincial ANC publications and direct communications with its mass base).

126. The innovative use of 'new media' was particularly evident during the 2009 elections campaign, pioneered by the ANC Youth League and is one of the explanations for the concerted outreach to young and first-time voters.
127. The engagement on the issues of communications remains an important part of ANC organisational strategy, as recognised by the extensive resolution from the 51st and 52nd National Conferences. The issue of ICT in the ANC has also arisen in the context of discussions about organisational design and modernising the operations of the movement.
128. Problems with the ANC membership system since the re-establishment of the ANC as a legal movement in 1990, have demonstrated the need for a system overhaul. Not only is our membership system inefficient (long waiting periods for membership cards, problems of renewals, etc), but it also poses a serious risk to the ANC, since the system can easily be manipulated.
129. Assessments of the membership system indicate that there are a number of challenges in the 'membership system value chain' that can be classified as information systems and technology problems. In addition to organisational processes and systems, there are a host of other areas, where we have only scratched the surface in terms of using ICT to improve organisational effectiveness.
130. For example, the 51st National Conference Resolution, reaffirmed by the subsequent national conference and general councils, called for all ANC regional and branch offices to be connected to the Internet, so as to aid internal communications and improve efficiency.

KEY ISSUES AND POLICY PROPOSAL

131. Though some progress has been made but we still have not fully realised the Stellenbosch Conference resolutions. To date all ANC provincial offices have internet access albeit with slow connectivity. Only four provincial offices have their own website pages, namely: Gauteng, Limpopo, KwaZulu-Natal and Mpumalanga. Northern Cape has encountered problems in setting up their website.
132. At this stage there is a problem with the connectivity of regions and only a handful of ANC branches have offices, and communications between upper structures and branches are still very much in the twentieth century (faxes, branch mail slots in provincial and regional offices which must be collected in person, letters delivered by organisers or REC members, etc).

133. To promote usage and universal access to ICTs amongst ANC members and the citizenry, the ANC should:
- a) Advocate for and monitor the achievement of universal access to ICTs, issues of affordability and expansion of broadband, through its organisational structures and government.
 - b) Ensure that its members are encouraged to understand the advantages of ICTs, and that they empower themselves through the attainment of e-skills.
 - c) Encourage branches to use ICT in communicating with individual members, including bulk SMS and emails on branch and regional activities. In addition the ANC website should be used to communicate with members and the public.
 - d) Develop and expand use of social media to engage with especially younger members.
134. The ANC needs to improve the ANC membership system, learning from other institutions that also have mass membership systems, including:
- a) Creating a secure online system for applying and paying for membership, as an option for those who have internet access.
 - b) A secure SMS based system for applying for and paying for membership as an option for those who have mobile access.
 - c) Immediately improve security of ANC membership system and databases to make them less open to manipulation, especially towards conferences, and consider the use of biometric technology.
135. We should not abandon our wish for connectivity of branches and regional offices:
- a) "One branch, one connected office by 2015" - NGC campaign and programme, with an implementation and funding plan to achieve this must be vigorously pursued.
 - b) Whilst branch offices may serve many organisational functions, branch level connectivity should not be dependent on a physical office. Already many of our members in almost every branch use their cellphones for personal e-mailing or web browsing.
136. We should see technology and ICT in particular as an enabler, not a substitute for traditional organising and campaigning methods. Sending SMSs, emails and other forms of messages to voters can be useful, but it

should not substitute direct voter engagement methods such as door-to-door work.

137. The ANC should continue to struggle for the sharing and participation of the poor and the marginalised sector of our communities to be active participants and beneficiaries of the opportunities created by the digital economy consistent with the goal of pursuing economic growth, development and redistribution so as to achieve a better life for all which is one of the key tasks of our National Democratic Revolution.
138. The ANC needs to strengthen and develop its capacity to stimulate demand to increase broadband usage and uptake by generating relevant content, across different communication mediums and for different target audiences. This includes its online presence, improving its research and monitoring capacity, strengthening forums for ideological and policy reflection such as ANC Today and Umrabulo, and developing writing skills, communications skills, skills relating to website and social media development and research skills amongst its cadres and leaders.
139. There is a need for a fresh beginning to bring into the fore a coherent framework, an institutional arrangement that enhances collaboration and effective planning and oversight within the ANC and government communication. The current status quo makes it difficult for the ANC to provide necessary oversight and to evaluate and measure communication impact of critical government institutions.
140. The ANC needs to develop its own ICT policy and strategy to drive its administrative and political systems. The said ICT policy and strategy must encompass the overall training of ANC staff and leaders starting with the branches.
141. The ANC further needs to strengthen and develop its capacity to manage its own internal IT systems. The IT must have a political champion to drive the ANC ICT policy and strategy including overseeing the implementation. The proper authority regarding the IT should be located within the Communications Unit to develop ICT platforms, manage membership system, including managing all conference registrations, and the like.
142. No edition of ANC Today should be published without an article from a minister highlighting their department's programme, progress and achievement with regard to the implementation of the ANC's programme of action in government. The ANC Today should further be a publication of choice for engaging, responding and debating current issues related and or affecting the ANC.
143. The ANC's communication machinery and effectiveness as the ruling party is as strong as the ANC government's communication machinery

and effectiveness. There is weakness in coordinated and streamlined government communications which has resurfaced in recent times which has had bearing on how the ANC communicates and performs on matters related to governance and service delivery.

144. For instance, the ANC government service delivery records are not readily communicated to influence and set the media agenda and thus do not form basis of dinner table and general media discussions. This is more clear during service delivery protests when in some instances people burned recently built schools, clinics and library in the protest against lack of service delivery.
145. The lack of government communication was also clearly evident during the recent national and local elections when it was left solely to the ANC campaign to highlight the ANC government achievements, contextualise the non-deliveries where they existed and still continued to battle for re-election in order to continue pursuing the ANC transformation agenda.
146. In a pro-active and coordinated government communication issues of service delivery would not form part of contest but what the future holds and which political part is best position to take our country forward. The government communication system would have highlighted service delivery and contextualised the challenges.
147. The ANC government needs to strengthen other effective communication methods to reach targeted communities like using community broadcasting and public broadcasting services (radio and print) to highlight government service delivery in the battle of ideas.
148. Government communication should reach all citizens and in all languages. Government Communication and Information System (GCIS) should be strengthened in order to coordinate information flow among different departments and among all three spheres of government (national, provincial and local).
149. The local government communication should be strengthened through enhanced training programmes and the GCIS should further offer communication support to parastatals and funding development institutions in order to properly profile work of these institutions.
150. Our government is one of the biggest advertising spenders. All spheres of government should advertise in the community and small commercial media that produce media in the languages spoken by communities, to assist the sustenance and growth of these media.
151. In view of the advent of digitisation and new media, government needs to investigate possible options of unmediated government communication

systems. The new opportunities provide a paradigm shift in government communications.

152. GCIS should support the communication of work done by other public and state owned entities that does not get media coverage. We must use arts and culture to enhance communication and convey the values of our democratic society, e.g. sculptures, murals and other forms of public art.
153. GCIS has been in existence for more than ten (10) years, and it may be necessary to review the extent to which we have met the recommendations of COMTASK and responding to challenges of government communications including agenda setting, empowerment of the citizenry with government information in order for the people to be their own liberators, including supporting efforts to favourable position our country as a preferred destination for tourism and investment.

CONCLUSION

154. South Africa has the potential to leapfrog its development through the adoption of policies and programmes that will over the next decade or so ensure a better life for all its citizens. A coordinated and targeted ICT policy developed by the end of 2012 is one such enabler to ensure that we build the human capacity of all citizens and grow an inclusive economy. The ANC needs to ensure that it advocate and lead in this regard.
155. Success in the mass deployment and roll out of ICTs to improve the lives of the South African people can only be realised if the ANC government plays its role of coordinating and directing in a seamless way the many initiatives that are found in the three spheres of government, the governmental agencies, public owned enterprises, private and community sectors.
156. ICTs, Communications, Media Transformation and Postal Policies does not exist in a vacuum but it is (and should) always be located within the broader developmental and growth policy context. The ANC policy interventions should always be tailor made to address subjective and objective challenges on the ground.
157. While much progress has been made to transform and grow the sector, a lot more still needs to be done to meet the objectives of our Vision 2030. Our approach to this vision, should seek to consolidate the link between the communications policy environment and the broader developmental and democratisation context.

158. The ANC's vision for the sector finds expression in various ANC Conference Resolutions and these resolutions reflect a perspective of the ANC over the years, although the evaluation of progress show that implementation has been constrained by our government's capacity to implement the ANC resolutions but they have also been constrained by policy incoherence and overlapping and often competing institutions.
159. This document provides a framework towards a consolidated National ICT Policy and Strategy that will enable us to use the information and communications technologies in an efficient and effective way to deliver services by government to citizens and business, in transaction between citizens and business, and in public administration for a better life for all.
